

Information and Installation Instructions

Iowa Culvert Hydraulics Software

Software Users Manual

The software users manual is available as a separate Acrobat file labeled "ICHSUM.pdf" on the web site.

You can copy the file from the web site to your hard-drive and print out the manual as you see fit.

The user manual describes how to use the software.

Installing the Software

There are two versions of the software. One using U.S. units and one using metric units. They are separate programs and you can install both on your computer.

Important Note

During installation some system files are installed for running visual basic and for database access.

During installation if the install program finds you have a newer version of a system file, it will ask if want to keep the newer version or replace it with the older version in the install files.

ALWAYS CHOOSE TO KEEP THE NEWER VERSION THAT ALREADY EXISTS ON YOUR SYSTEM. THE SOFTWARE WILL WORK FINE WITH AN EXISTING NEWER VERSION OF SYSTEM FILES.

Installing from the web site

The program files are available on the web site in self-extracting zip files. The files for the english and metric versions are labeled "English Culvert Hyd.exe" and "Metric Culvert Hyd.exe" respectively. Each file contains three installation files. They are: Iachus.cab/Iachsi.cab, setup.exe and Setup.lst.

To install the software the three files installation files simply need to be in the same directory. For example, you could create a directory on your hard drive (i.e. ICHUSInstall), then download the zipped from the web site to the directory. Run the zip files (double click in Windows Explorer) to extract the installation files. Then run setup.exe and the installation program will run and install the

software. Please note that the english and metric versions of the installation files should be located in separate directories.
