

1. Why are there intersections where roads do not intersect?

The Office of Research and Analytics provided the intersection locations based on preliminary data sets provided by various offices at the DOT. We were aware the data was not 100% accurate, however due to the time constraints felt this was the most efficient data set we could provide for analysis. If you come across an intersection we have identified and it is not a valid intersection please mark the intersection as "Invalid" or leave it blank.

2. The speed limits at an identified intersection are lower than 55 mph. How should I address these intersections?

The speed limits for the intersections were derived using our road inventory system (GIMS). If the intersection we have identified does not have a speed limit of 55 mph please mark the intersection as "Not 55" or leave it blank.
